

ABSTRACT

Markers, methods of marking, and marking systems for use in association with images are disclosed. One marker is removable with a targeted design and metric
5 dimensions inscribed on a clear plastic flap. This marker is attached adjacent to an area of interest with the target placed in such a manner to precisely pin point out an observed abnormality. A paper label at one edge is available for written comments and directions for further studies. The marker can be removed without damage to the image(s).
